# Raising the Bar District-Wide Using Symphony Math 

Symphony Learning: Research Study 02262020<br>Paul Schwarz, M Ed.

#### Abstract

Students and staff from Graves County, Kentucky, participated in a study during the 2018-19 school year to examine the effect of the Symphony Math foundational numeracy program in grades 1 through 4. In order to provide comparison, approximately half the population used Symphony Math as their sole technology intervention, while the other half participated in the standard district math curriculum, which combined different online and offline resources. As students used Symphony Math, teachers were able to monitor their progress and provide interventions when necessary using data dashboards and recommended offline materials. District policy included administration of the STAR® Math assessment to the full student population at several dates during the school year. The results from this third-party testing show that students who used Symphony Math made significant gains in math achievement and, on average, outperformed their peers in the district who did not use the program.

## Introduction

A number of research studies have demonstrated that struggling math students often have an underdeveloped understanding of foundational numeracy. Graves County Schools are located in the western region of Kentucky. The student population in the district was 4,073 in 2017 . The demographic makeup of the district is over $87 \%$ White (non-Hispanic), and over $57 \%$ of students qualify for free or reduced lunch. After being introduced to Symphony Math through a local company, the district began a pilot of Symphony Math in August of 2018. In October 2018 the pilot was refined to focus on early elementary students. Since several populations had not used the program, the district agreed to participate in a study by Symphony Learning designed to measure the difference in achievement between students who used Symphony Math and students who did not use the program. This report summarizes the implementation of the program and subsequent results.

## Participants

Students from Graves County Schools in grades K-4 participated in the use of Symphony Math during the 2018-19 school year. Only grades 1-4 were used in this analysis due to the lack of consistent third-party testing results in the Kindergarten population. The treatment group, who used Symphony Math, came from 5 of the 7 elementary schools in grades 1 and 2, and two of the schools in grades 3 and 4. The control group, who did not use Symphony Math, was comprised of 2 elementary schools in grades 1 and 2 , and 5 elementary schools in grades 3 and 4. Overall, 579 students comprised the treatment group, while 624 students were included in the control group.

## Implementation

The Elementary Instructional Supervisor in Graves County received initial training and support from a qualified Symphony Math regional representative, including several on-site visits, telephone, and email support. A goal of 45 minutes of use per week for students was set. Student use was shown to be consistent throughout the school year, as is shown in Figure A.

In addition, each participating school received additional in-person training in October 2018. Each grade level team participated in a 30-minute information session that focused on data analysis and use of the program's offline materials in order to better support students as they used Symphony Math.

Figure A: Use of Symphony Math in Graves County

The blue bars throughout the school year show that many students used Symphony Math at least 45 minutes per week consistently throughout the school year. An average of 22.8 hours use was noted across the entire population of students. While there was variance noted between individual students and classrooms (see Appendix B), no distinction was made for the purposes of analysis in this study. If students used Symphony Math, their data was reported in the treatment group regardless of time spent on the program. This decision was made because, despite variance in use, classroom instruction and decision-making was affected by use of the program.

## Intervention

Symphony Math is an intervention program designed to help students develop a profound
understanding of the most important mathematical concepts. Many students struggle to become proficient in math because they do not have the opportunity to master foundational concepts with sufficient depth. In an age when most curricula value covering a large number of topics, some students are falling through the cracks. They need more time and more practice working with the big ideas of mathematics in order to develop the proper foundation.

Symphony Math provides students with the experience of learning and thinking about the most important mathematical concepts. This experience provides the necessary foundation for a successful future of math learning. Symphony Math helps students achieve this solid mathematical foundation by implementing several key research-based pedagogic strategies.

The conceptual sequence of Symphony Math consists of a tightly connected progression of the most important mathematical ideas. These underlying "big ideas" are important because they provide the foundation for later mathematical learning. A student does not move on to the next concept in the Symphony Math sequence until she has mastered the current concept. One concept follows logically from the previous concept. While a student is working on a new concept she sees review concepts that help support her learning of the new concept. This process helps the student connect new knowledge to previous knowledge.

Symphony Math uses visual models to help students formalize their understanding of foundational number sense concepts. Students construct bar models, counting dots, number lines, grids, and fraction strips in their investigation of the most important ideas in mathematics. A concrete-to-abstract approach gradually introduces symbols, and always uses models in the justification of correct solutions.

The pedagogic style of Symphony Math emphasizes thinking, figuring out, and making connections. The program is designed to be used as a complement to the classroom learning
experience. Students receive direct instruction and group learning in a classroom setting. The program provides the opportunity for individual practice at the developmental level of each student. The style of this practice encourages independent thinking and problem solving, and this is accomplished through the use of these important pedagogic strategies.

Symphony Math works with each student at his or her developmental level. The "dynamic branching" of the program and detailed progression of the scope and sequence allows students to work within their developmental zones. The amount of time and practice that students need to understand mathematical concepts is not uniform. Symphony Math allows students to spend the time they need in order to master foundational concepts. In addition, the program quickly moves students through the conceptual progression of the program to identify their area of need. Once the area of need has been identified, the program slows the progress until the necessary understanding has been achieved.

In addition to adjusting the pace of progress, Symphony Math also alerts educators of the need for intervention when students show signs of struggle. For every skill covered in the program, offline Guided Practice materials are available. Educators can use these materials to structure small group or 1:1 work sessions with students. The offline materials offer a chance for educators and students to express their understanding of difficult topics, and they are an important key to successful implementations.

## Assessment

All participating students were given the STAR $360 ®$ Math assessment (STAR), by Renaissance Learning, several times during the 2018-19 school year. The assessment Growth Report provides a Scale Score (SS), Percentile Rank (PR), National Curve Equivalents (NCE), and Grade Equivalent (GE) for each student based on norm referenced scores. The multiple administrations of testing
allow for comparisons in growth during the school year.

## Analysis

This study compares results on the STAR assessment in grades 1 through 4 between the treatment and control groups. The assessment was administered at the beginning of the school year (August), late fall, winter, and spring (April). The results provided for this analysis were taken from the STAR Growth Report, and compared student results in the first and last administrations of the assessment.

A preliminary analysis of data compared percentile rank (PR) averages of class groupings. Though significant gains were found, it was agreed that further analysis was needed at the student-level. See Appendix B for details on this preliminary data.

Students included in this analysis needed to have at least two assessment results. There were 23 students in the population who did not meet this requirement. They are not included in this analysis.

Out of Scale Scores (SS), Grade-Equivalent (GE) scores, Percentile Ranks (PR), and Normal Curve Equivalent (NCE) scores, only NCEs were analyzed. Visual inspection of the data revealed that, for some students the STAR data report did not indicate a specific GE score. Instead the report indicated, for example, $<1,>5,>6$. These scores would make it hard to make specific comparisons.

An independent samples t-test revealed that the groups' (treatment and control) pre-SS scores were significantly different, $p<.001$; therefore, SS were not included in the analysis.

The pre-PR scores violated assumptions of normality and equal variance. Therefore, these scores were not directly analyzed, instead NCE scores were. NCE is a norm-referenced score similar to percentile rank but based on an equal interval scale. For the pre-NCE scores there were unequal sample sizes (control: $n=624$; treatment:
$n=579$ ). Furthermore, boxplots revealed that there were 2 potential outliers in the control group and 4 potential outliers in the treatment group. However, the research found it important to consider all of the students' data and did not want to remove these potential outliers.

For the control group, both Kolmogorov-Smirnov and Shapiro-Wilk tests of normality were violated, $p<.001$. For the treatment group, the Kolmogorov-Smirnov test was passed, $p=.077$, but the Shapiro-Wilk test was violated, $p<.001$. However, pre-NCE scores passed Levene's test for equality of variance, $p=.430$.

Based on this information, an independent samples t-test was used to compare the groups on their pre-NCE scores. The groups were not significantly different on their pre-NCE scores, $p=$ .574. Based on this finding, difference scores (post-test minus pre-test) were calculated for NCE. The NCE difference scores were then tested for outliers, violations of normality, and violations of variance. Potential outliers were present in both groups; however, the researcher wished to keep this data. For the control group, the Kolmogorov-Smirnov test was passed, $p=.200$, but the Shapiro-Wilk test was violated, $p=.001$. For the treatment group, both Kolmogorov-Smirnov ( $p$ $=.004$ ) and Shapiro-Wilk tests of normality were violated, $p<.001$. However, the NCE difference scores passed Levene's test for equality of variance, $p=.430$.

Based on this information, an independent samples t-test was used to compare the groups on their NCE difference scores. This test was significant, $t(1201)=-7.23, p<.001,95 \% \mathrm{CI}$ [-7.05, -4.04$]$, with the treatment group having higher NCE difference scores ( $M=12.34, S D=$ 13.61) than the control group ( $M=6.79, S D=$ 12.99).

## Results

Comparison of results from the STAR growth report showed a significant difference in gains in student NCE using 579 students from the

Symphony Math (treatment) group and 624 students from the control group.

Students who used Symphony Math were seen to gain an average of 12.34 NCE points during the course of the school year. Their peers who did not use Symphony Math gained an average of 6.79 NCE points.

|  | Pre NCE | Post NCE | Difference |
| :--- | :---: | ---: | ---: |
| Control | 60.1771 | 66.9675 | 6.79 |
| Symphony <br> Math | 60.7779 | 73.1138 | 12.34 |

## Conclusion

Graves County identified foundational number sense as a critical need of all students. During the 2018-19 school year, a study was undertaken to research the results of adding Symphony Math to support students in the goal of mastering key components of numeracy that enable math success. The district implemented the program as a regular part of students' week, and also supported teachers by including data review and focused Math Specialist interventions for struggling students.

When observing growth as measured by an independent assessment instrument, and comparing students to their peers in the district, students who used Symphony Math made significant growth during the course of the school year, and also outperformed their peers.

## Appendix B: Preliminary Group Analysis

NOTE: This data was not used in the formal conclusions, but is included for transparency. It was determined after preliminary analysis that National Curve Equivalent (NCE) was a better statistic to use with group averaging. https://stats.idre.ucla.edu/stata/faq/how-should-i-analyze-percentile-rank-data/

## STAR Math Assessment Data per grouping (and Symphony Math Use)

|  |  | Fall 2018 |  | Spring 2019 |  | Gain |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Group | n | Mean | SD | Mean | SD |  |
| Symphony | 29 | 69.28 | 7.78 | 85.07 | 6.96 | $15.79^{* *}$ |
| Control | 29 | 66.17 | 14.42 | 77.14 | 10.56 | 10.97 |

** Statistically significant at the $\mathrm{p}<0.01$ level

Methodology: A Mann-Whitney $U$ test revealed that the treatment $(\mathrm{n}=29)$ and control ( $\mathrm{n}=29$ ) groups were significantly different on their post-PR gain scores, $(U=203.50, Z=-3.38, p<.001)$. The median for the control group for post-PR gain score was 79 (quartile range: 71.50 to 84.50 ), the treatment group's median was 85 (quartile range: 82.50 to 89.50 ).

## Acknowledgments

This study included many people in the planning, participation, and post-study analysis. The talented and dedicated educators in Graves County were very thorough in the identification of control and treatment groups, and followed through with a very consistent and uniform implementation. Their energy helped the students in Graves County use Symphony Math following the best practices. Academic Edge helped to train and support educators as they used the data dashboards and offline materials during the year.. Toby Caplin helped enormously in the draft and editing of this document. Kelsey Carlson, PhD, provided a much-needed critique of the original statistics used in the original findings of the study. Her work in providing a proper and thorough analysis validated the original findings and is greatly appreciated.
